## Exercise 4.2 (Small 3/2 points)

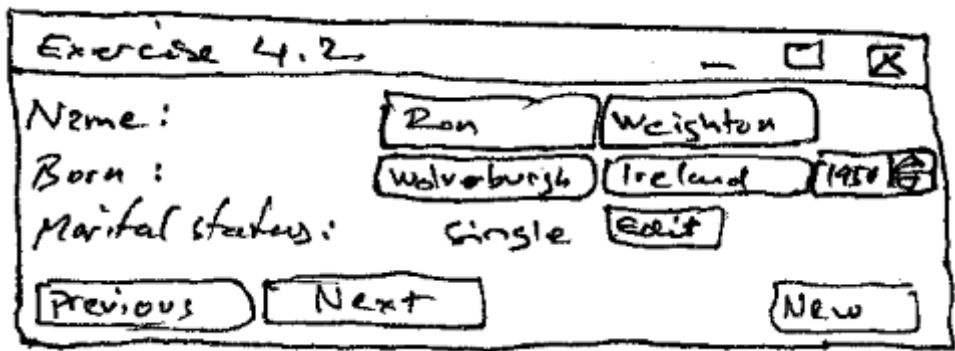

Build an interface for editing Person objects familiar from the earlier exercises. At least name, birth place, country and year must be editable. (You can reuse your existing earlier work).

**With Java:** Person objects should be loaded from a resource (Notice that there is a version of the loadPerson in Person.java which accepts InputStream as a parameter). You can't write to resources so don't worry about saving back the edits.

**User a spinner for editing birth year. Enable drag-n-drop in all relevant components. Other than that,** you can freely design the interface.

**With React:** The person data must be in a separate .js file in src folder where you import it.

Use text field for birth year input but validate the input so that only numbers can be entered.
